

7.6 Disjoint Paths

Edge Disjoint Paths

Disjoint path problem. Given a digraph $G = (V, E)$ and two nodes s and t , find the max number of edge-disjoint s - t paths.

Def. Two paths are **edge-disjoint** if they have no edge in common.

Ex: communication networks.

Edge Disjoint Paths

Disjoint path problem. Given a digraph $G = (V, E)$ and two nodes s and t , find the max number of edge-disjoint s - t paths.

Def. Two paths are **edge-disjoint** if they have no edge in common.

Ex: communication networks.

Edge Disjoint Paths

Max flow formulation: assign unit capacity to every edge.

Theorem. Max number edge-disjoint s-t paths equals max flow value.

Pf. \leq

- Suppose there are k edge-disjoint paths P_1, \dots, P_k .
- Set $f(e) = 1$ if e participates in some path P_i ; else set $f(e) = 0$.
- Since paths are edge-disjoint, f is a flow of value k . ▪

Edge Disjoint Paths

Max flow formulation: assign unit capacity to every edge.

Theorem. Max number edge-disjoint s-t paths equals max flow value.

Pf. \geq

- Suppose max flow value is k .
- Integrality theorem \Rightarrow there exists 0-1 flow f of value k .
- Consider edge (s, u) with $f(s, u) = 1$.
 - by conservation, there exists an edge (u, v) with $f(u, v) = 1$
 - continue until reach t , always choosing a new edge
- Produces k (not necessarily simple) edge-disjoint paths. ■

can eliminate cycles to get simple paths if desired

Network Connectivity

Network connectivity. Given a digraph $G = (V, E)$ and two nodes s and t , find min number of edges whose removal disconnects t from s .

Def. A set of edges $F \subseteq E$ **disconnects t from s** if all s - t paths uses at least on edge in F .

Edge Disjoint Paths and Network Connectivity

Theorem. [Menger 1927] The max number of edge-disjoint s - t paths is equal to the min number of edges whose removal disconnects t from s .

Pf. \leq

- Suppose the removal of $F \subseteq E$ disconnects t from s , and $|F| = k$.
- All s - t paths use at least one edge of F . Hence, the number of edge-disjoint paths is at most k . ▪

Disjoint Paths and Network Connectivity

Theorem. [Menger 1927] The max number of edge-disjoint s - t paths is equal to the min number of edges whose removal disconnects t from s .

Pf. \geq

- Suppose max number of edge-disjoint paths is k .
- Then max flow value is k .
- Max-flow min-cut \Rightarrow cut (A, B) of capacity k .
- Let F be set of edges going from A to B .
- $|F| = k$ and disconnects t from s . ▪

7.11 Project Selection

Project Selection

can be positive or negative

Projects with prerequisites.

- Set P of possible projects. Project v has associated revenue p_v .
 - some projects generate money: create interactive e-commerce interface, redesign web page
 - others cost money: upgrade computers, get site license
- Set of prerequisites E . If $(v, w) \in E$, can't do project v and unless also do project w .
- A subset of projects $A \subseteq P$ is **feasible** if the prerequisite of every project in A also belongs to A .

Project selection. Choose a feasible subset of projects to maximize revenue.

Project Selection: Prerequisite Graph

Prerequisite graph.

- Include an edge from v to w if can't do v without also doing w .
- $\{v, w, x\}$ is feasible subset of projects.
- $\{v, x\}$ is infeasible subset of projects.

feasible

infeasible

Project Selection: Min Cut Formulation

Min cut formulation.

- Assign capacity ∞ to all prerequisite edge.
- Add edge (s, v) with capacity p_v if $p_v > 0$.
- Add edge (v, t) with capacity $-p_v$ if $p_v < 0$.
- For notational convenience, define $p_s = p_t = 0$.

Project Selection: Min Cut Formulation

Claim. (A, B) is min cut iff $A - \{s\}$ is optimal set of projects.

- Infinite capacity edges ensure $A - \{s\}$ is feasible.
- Max revenue because:

$$\begin{aligned} \text{cap}(A, B) &= \sum_{v \in B: p_v > 0} p_v + \sum_{v \in A: p_v < 0} (-p_v) \\ &= \underbrace{\sum_{v: p_v > 0} p_v}_{\text{constant}} - \sum_{v \in A} p_v \end{aligned}$$
